

Document Conversion Field Guide

Mixed Office files, metadata, and semantic indexing

This field guide describes the content that a conversion pipeline should preserve when it reads Office files, web captures, and structured exports. It covers sheet context, code fragments, path metadata, incremental indexing, and search-oriented chunk boundaries.

The guide includes repeated terms, code, URLs, tables, and long prose so a PDF converter can be checked against both readable output and full-text extraction.

Source feature	Example	Expected result
Sheet name	RN_WebView	Appears before sheet content
Code	EnsureCoreWebView2Async	Remains searchable
URL	https://example.test/webview/1001	Preserved as text
Path	\\pc135\D\Desktop\SampleFolders\file.xlsx	Retained in metadata

Workbook context 1

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 1, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

```
await webView.EnsureCoreWebView2Async(null);
webView.CoreWebView2.PostWebMessageAsString(payload);
const chunk = { file_path, chunk_index, chunk_total };
```

Metric	Value	Interpretation
Latency ms	20	Measured after reload
Payload KB	5	May cross a chunk boundary
Status	open	Keep source label

Reference: <https://developer.microsoft.com/en-us/microsoft-edge/webview2/> and <https://github.com/react-native-webview/react-native-webview>

WebView lifecycle 2

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 2, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Security observations 3

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 3, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Performance logs 4

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 4, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Chunk metadata 5

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 5, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

```
await webView.EnsureCoreWebView2Async(null);
webView.CoreWebView2.PostWebMessageAsString(payload);
const chunk = { file_path, chunk_index, chunk_total };
```

Incremental indexing 6

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 6, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Metric	Value	Interpretation
Latency ms	45	Measured after reload
Payload KB	15	May cross a chunk boundary
Status	resolved	Keep source label

Search verification 7

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 7, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Workbook context 8

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 8, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

WebView lifecycle 9

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 9, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

```
await webView.EnsureCoreWebView2Async(null);
webView.CoreWebView2.PostWebMessageAsString(payload);
const chunk = { file_path, chunk_index, chunk_total };
```

Security observations 10

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 10, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can

distinguish the sources.

Performance logs 11

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 11, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Metric	Value	Interpretation
Latency ms	70	Measured after reload
Payload KB	25	May cross a chunk boundary
Status	investigating	Keep source label

Chunk metadata 12

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 12, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Incremental indexing 13

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 13, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

```
await webView.EnsureCoreWebView2Async(null);
webView.CoreWebView2.PostWebMessageAsString(payload);
const chunk = { file_path, chunk_index, chunk_total };
```

Search verification 14

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 14, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Workbook context 15

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 15, included to create realistic page density and chunk boundaries. If the same

phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

WebView lifecycle 16

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 16, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Metric	Value	Interpretation
Latency ms	95	Measured after reload
Payload KB	35	May cross a chunk boundary
Status	open	Keep source label

Security observations 17

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 17, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

```
await webView.EnsureCoreWebView2Async(null);
webView.CoreWebView2.PostWebMessageAsString(payload);
const chunk = { file_path, chunk_index, chunk_total };
```

Performance logs 18

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 18, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Chunk metadata 19

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 19, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Reference: <https://developer.microsoft.com/en-us/microsoft-edge/webview2/> and <https://github.com/react-native-webview/react-native-webview>

Incremental indexing 20

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away

from the nearest table. This is field note 20, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Search verification 21

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 21, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

```
await webView.EnsureCoreWebView2Async(null);
webView.CoreWebView2.PostWebMessageAsString(payload);
const chunk = { file_path, chunk_index, chunk_total };
```

Metric	Value	Interpretation
Latency ms	120	Measured after reload
Payload KB	45	May cross a chunk boundary
Status	resolved	Keep source label

Workbook context 22

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 22, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

WebView lifecycle 23

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 23, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Security observations 24

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 24, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Performance logs 25

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 25, included to create realistic page density and chunk boundaries. If the same

phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

```
await webView.EnsureCoreWebView2Async(null);
webView.CoreWebView2.PostWebMessageAsString(payload);
const chunk = { file_path, chunk_index, chunk_total };
```

Chunk metadata 26

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 26, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Metric	Value	Interpretation
Latency ms	145	Measured after reload
Payload KB	55	May cross a chunk boundary
Status	investigating	Keep source label

Incremental indexing 27

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 27, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Search verification 28

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 28, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Reference: <https://developer.microsoft.com/en-us/microsoft-edge/webview2/> and <https://github.com/react-native-webview/react-native-webview>

Workbook context 29

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 29, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

```
await webView.EnsureCoreWebView2Async(null);
webView.CoreWebView2.PostWebMessageAsString(payload);
const chunk = { file_path, chunk_index, chunk_total };
```

WebView lifecycle 30

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 30, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Security observations 31

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 31, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Metric	Value	Interpretation
Latency ms	170	Measured after reload
Payload KB	65	May cross a chunk boundary
Status	open	Keep source label

Performance logs 32

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 32, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Chunk metadata 33

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 33, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

```
await webView.EnsureCoreWebView2Async(null);
webView.CoreWebView2.PostWebMessageAsString(payload);
const chunk = { file_path, chunk_index, chunk_total };
```

Incremental indexing 34

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 34, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Search verification 35

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 35, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Workbook context 36

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 36, included to create realistic page density and chunk boundaries. Security observations 59

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 59, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Performance logs 60

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 60, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Chunk metadata 61

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 61, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

```
await webView.EnsureCoreWebView2Async(null);
webView.CoreWebView2.PostWebMessageAsString(payload);
const chunk = { file_path, chunk_index, chunk_total };
```

Metric	Value	Interpretation
Latency ms	320	Measured after reload
Payload KB	125	May cross a chunk boundary
Status	open	Keep source label

Incremental indexing 62

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 62, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Search verification 63

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 63, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.

Workbook context 64

A converted file should retain the relationship between a heading, a platform label, an observation, and the reference URL that supports the observation. The source may contain blank rows, repeated headers, or a note placed far away from the nearest table. This is field note 64, included to create realistic page density and chunk boundaries. If the same phrase occurs in multiple files, search results should preserve the file path and chunk index so an operator can distinguish the sources.
